ABSTRACT

Prior to the discovery of the Qumran and Judaean Desert material, transmission theories of the Hebrew Bible conducted its investigation of textual variation by means of manuscript stemma, among which ₣ and its associated scribal school was the golden rule. With nearly seventy years of research now complete, scholars have emended their methodological framework to account for textual variation by means of the scribal practices of the Second Temple era. To analyze textual variations vis-à-vis scribal practices and approaches has required that scholars incorporate historical linguistics into the existing philological methods. The linguistic categories of orthography, phonology, and morphology have received a significant amount attention, mostly in Emanuel Tov’s Non-Aligned theory. However, syntax has received little attention. To test the hypothesis that syntax should likewise be incorporated into transmission theory methodology, several case studies from the Judaean Desert Isaiah corpus are presented. The conclusion of the present study affirms that syntax offers a viable method to account for extant readings witnessed in the Judaean Desert Isaiah corpus.
